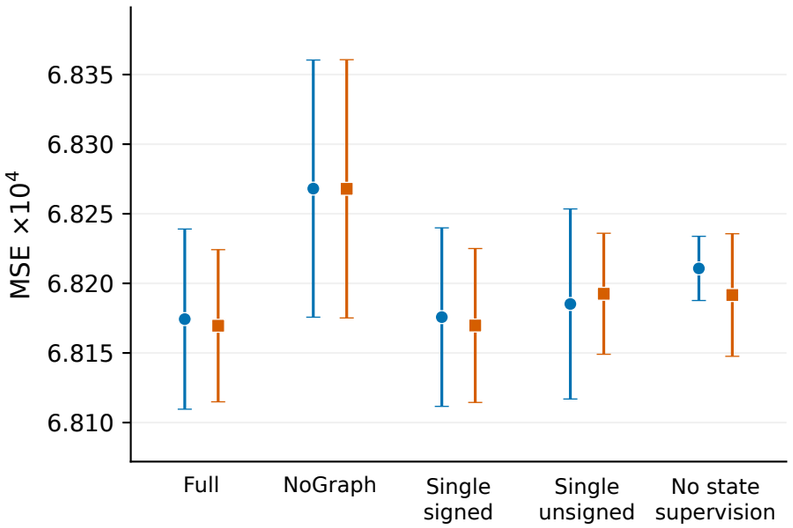
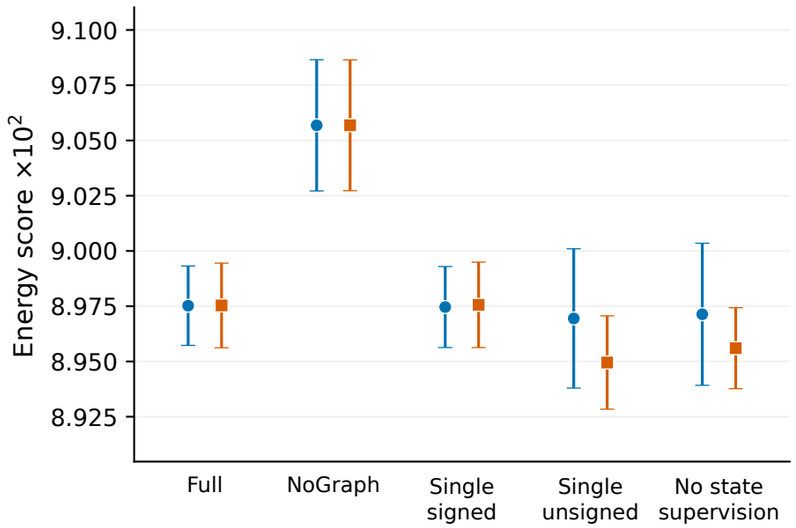
Validation-selected configuration

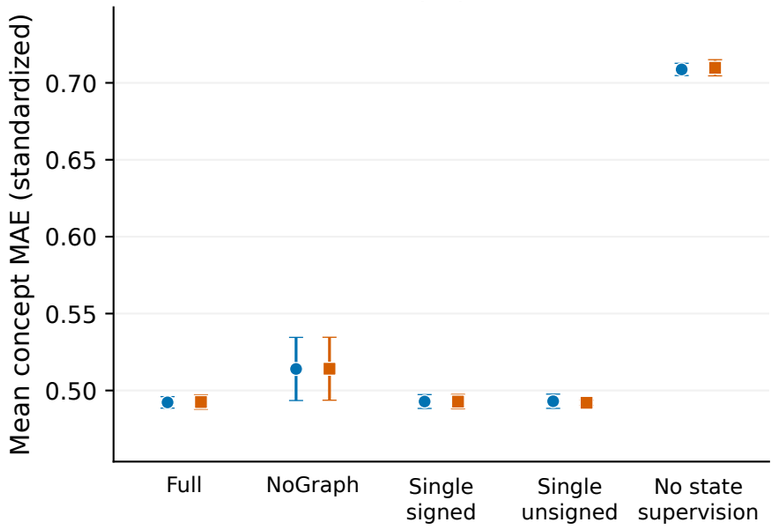
(a) Point error



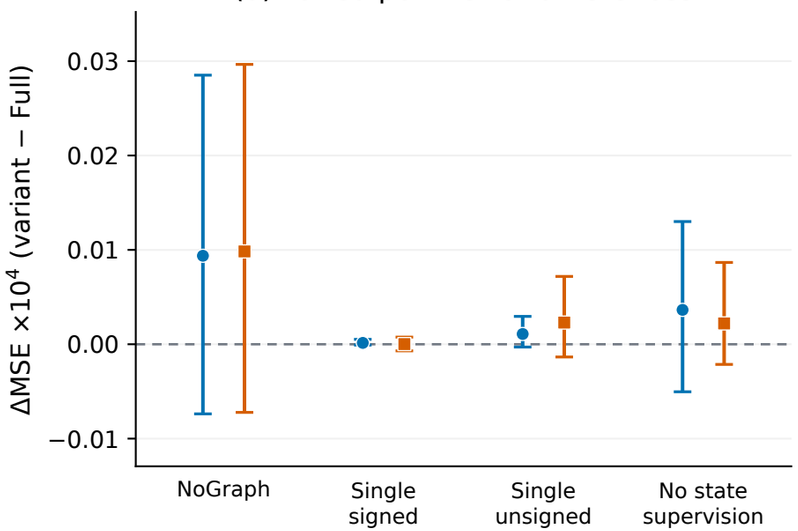
(b) Distribution score



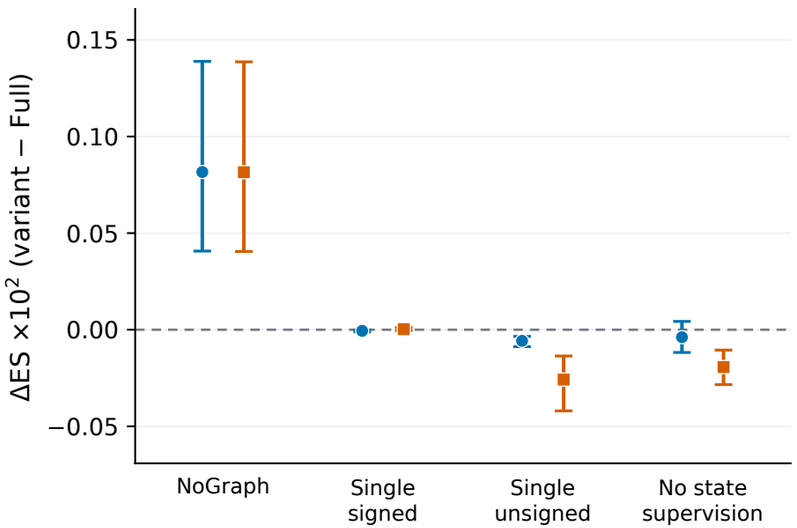
(c) Concept prediction



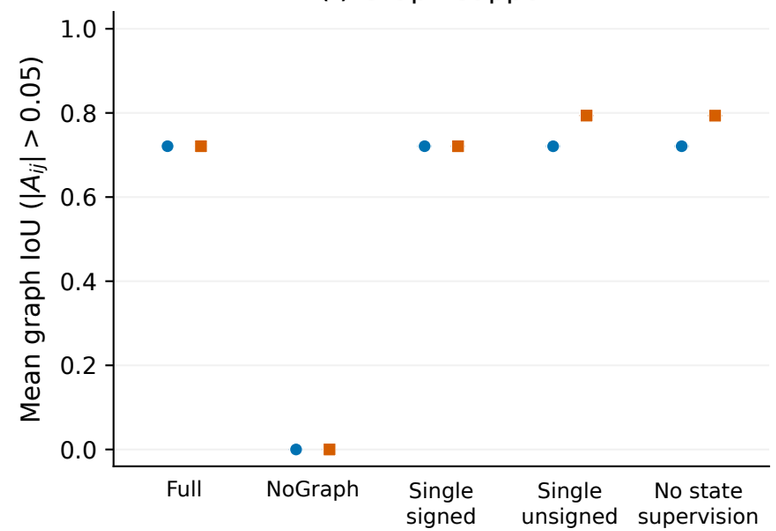
(d) Paired point-error differences



(e) Paired distribution-score differences



(f) Graph support



(a–c,f): mean ± seed SD. (d,e):95% temporal block-bootstrap CI, after averaging matched seed losses per origin.
Positive paired loss differences favor Full. NoGraph removes the A channel but retains market-state residual-dependence information.
